Humidifiers Can Help From Dryness

[How do humidifiers work?](#)

Many of our skin gets dry in the Winter. It doesn't matter how oily the skin is, if it is not moisturised properly it still gets dry. It is very important to keep our skin moisturised at all times. One of the ways to keep your skin moisturised is through humidifiers. One of the biggest markets for humidifiers or **Luftbefeuchter** is in Germany as the temperature does get to -10 sometimes.

During the winter we tend to keep the heater on most of the time when we are at home. From this your skin can get damaged with dry skin and rashes. There are different types of humidifiers to choose from but my suggestion would certainly be the steam humidifiers. It boils water and releases the warm steam into the room. Also in the water you can add Vicks to make the air more fresh. Or you can purchase the Vicks humidifier. This generates droplets from water which then floats into the air.

There are other humidifiers you can choose from such as ultrasonic and evaporative system. Cool fog is generated through Ultrasonic humidifier and it is also very silent. Wick or evaporative system normally lets the air absorb moisture.

You will be able to find cheap humidifiers when you search online. These days there is a mass amount of competition on the Internet. You will definitely find something good in a cheap price. You don't require a big space to install the humidifiers. As it is so small you can install it within a room as portable room unit.

In my living room last winter I installed a steam humidifier. Before I purchased the humidifier my skin used to get dry easily during the winter but since I have installed this humidifier my skin feels fresh and moisturised at all times. It can be very useful if you have children at home.
